

National Competence Center (NCC)

- NORCE, Sigma2 and SINTEF partners in the Norwegian national competence center.
- Funded by EU and KDD.
- Focus on applications requiring heavy utilization of ICT resources.
- A hub for competence, offer or federate.
- Mainly resource for industry and public sector.

National Competence Center (NCC)

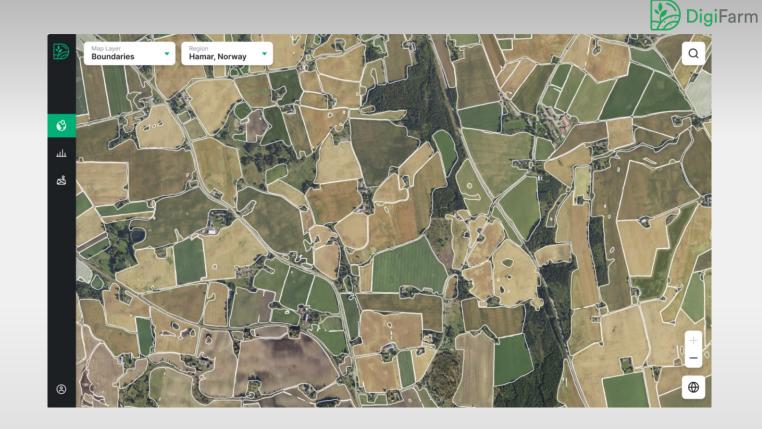

- Supplementary competence through NORCE, SINTEF and other collaborators.
- Complementary support offered due to EU and KDD support.
- Can also provide test-before-invest access to hard resources.
- One-to-one dialogue and understanding.
- Use-case work, provides added-value quickly.

Digifarm

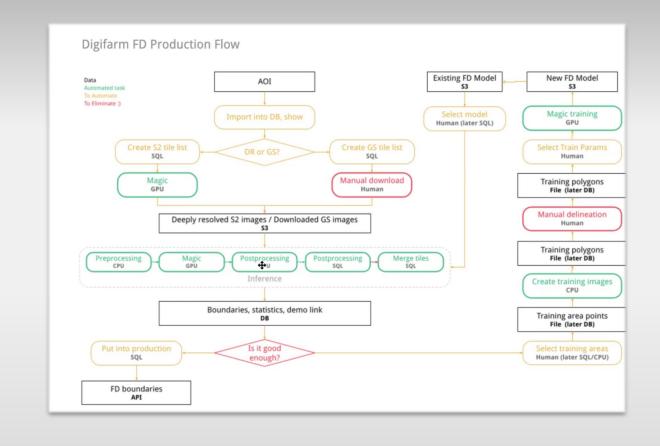

- Automatic Detection of Field Boundaries and Seeded Acres
- Change of property
- Optimization of crop distribution
- Satellite resolution too low

Digifarm

- Proprietary algorithm to improve resolution from 10m to 1m per pixel.
- Optimization of workflow
- Optimize computing resources usage
- Scaling to reduce wall times

Zeabuz

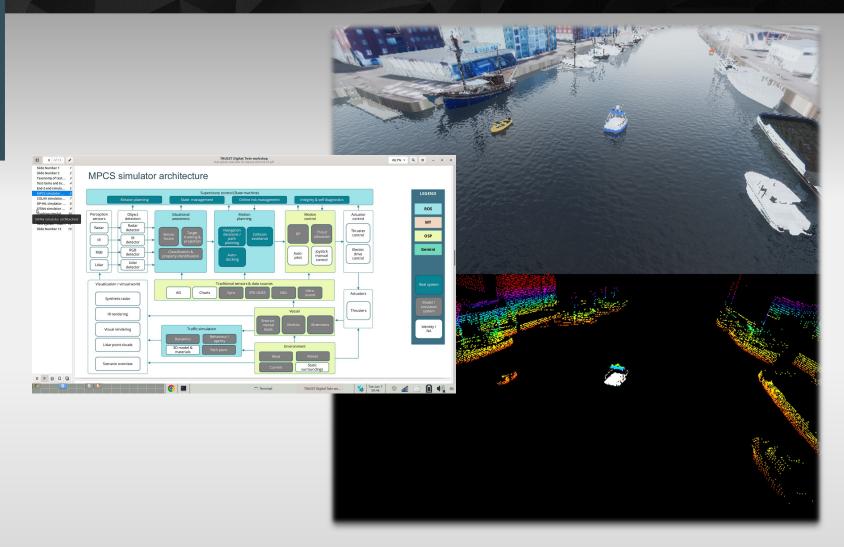

- Autonomous commuting
- Unused city waterways
- Increased reliability and availability
- Reduced cost
- Need to react properly

Zeabuz

- Optimization of workflow
- Mapping of scenario portfolio
- Scenario simulations to train how system react to incidents
- Test if reactions to incidents gives intended behaviour

3B - Fibreglass

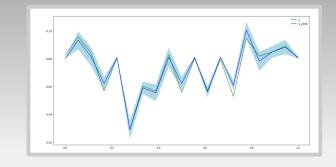

- Improve quality and consistency of fibreglass product
- Using available data to tune process
- Obtain state of current production
- Limited knowledge on using data to detect and determine patterns

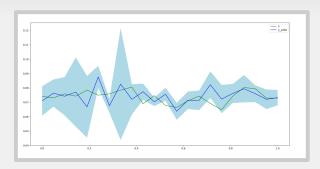

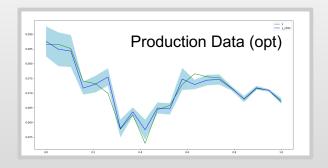

3B - Fibreglass

- Formation moisture as quality measure
- 20 inputs, 40 locations, 14 materials, over 1+ years
- Cleaning input data
- Fitting model to production data to estimate the status of the production

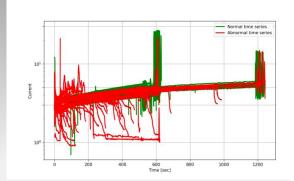

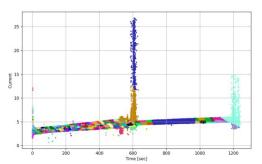

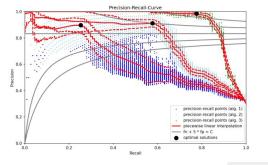

3B - Fibreglass

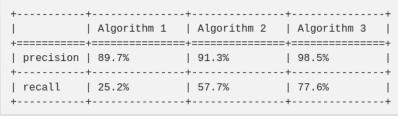

- Detecting breaks in glass-fibre on wind turbine blades
- Using detection of anomalies in electrical current
- The electrical currents of the wind turbine motors are modelled by semisupervised learning

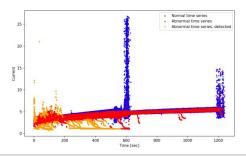

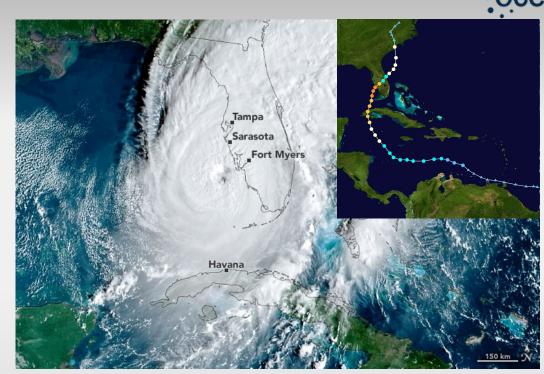

oceanTHERM

- Hurricanes are extremely invasive
- Reduce ocean surface temperature to reduce energy supply to storm systems
- Less severe storms with lower societal and environmental impact. Save human life and costs
- Large scale, need to predict trajectories and document impact of mitigating measures

Hurrican Ian, 26th September 2022

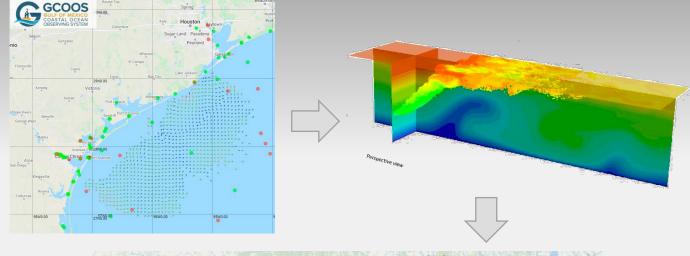

photo: https://earthobservatory.nasa.gov/

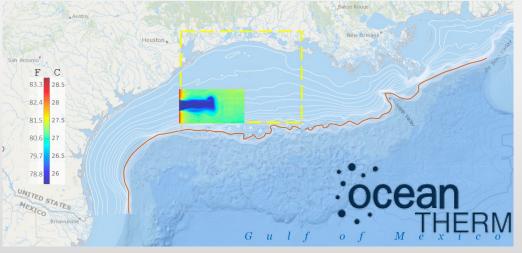

- 250 km winds, landfall Cayo Costa west of Fort Myers.
- Cuba: Damages >200 MUSD 11 fatalities
- USA: Damages > 50000 MUSD 147 fatalities (28% of the Norwegian Governments planned expenditure for 2023)

oceanTHERM

- Raise cold water from the lower depths to the surface
- Using bubble curtains and existing infrastructure/knowledge from sub-sea industry
- Use ocean currents to naturally cover large areas from a limited number of installations
- Calculate where bubble curtain should be placed and estimate impact before use.

This project has received funding from the European High-Performance Computing Joint Undertaking (JU) under grant agreement No 951732, in collaboration with the The Research Council of Norway. The JU receives support from the European Union's Horizon 2020 research and innovation programme and Germany, Bulgaria, Austria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Greece, Hungary, Ireland, Italy, Lithuania, Latvia, Poland, Portugal, Romania, Slovenia, Spain, Sweden, United Kingdom, France, Netherlands, Belgium, Luxembourg, Slovakia, Norway, Switzerland, Turkey, Republic of North Macedonia, Iceland, Montenegro
